Self-Watering Planter

Designed and Manufactured in Portland, OR by Joey Roth

DESCRIPTION

Self-watering planters designed for use indoors or outside with herbs and succulents. Made from Terracotta and Zisha: naturally porous unglazed earthenware.

Soil capacity: 2.5 liters. Water capacity: 0.4 liters.

Designed for up to three herbs or six succulents.

How the Self-Watering Planters Work: The self-watering planter's porous walls allow water in the central chamber to seep into the surrounding soil. The plants' roots find the source of water in the soil and grow around the central chamber. Through capillary action, the plants draw just as much water as they need.
